

# Code Quest

Rohith Perumalla | 5/8/17

I recently had the opportunity to represent my school and compete at Lockheed Martin's Annual Code Quest Competition. I participated at the Fort Worth Campus. The event was composed of a coding contest and a tour of the facility. The contest was a great way for me and my team to put our skills to a test and also learn from other teams from around the state. It was an interesting format: each problem had a specific amount of points you would get depending on the difficulty. I believe one of the interesting aspects of the competition was that between the end of the competition and the announcements of the results there was time for teams to talk to each other and discuss problems and their solutions. After the competition, we also got a chance to get a tour around the factory and see planes in the progress of being built. We learned about the different tools being used in the facilities, as well as the assembly format of the factory. We saw fighter jets that were in various stages of assembly. Overall the event was a great experience to get a chance to work as a team to work on our coding abilities and even meet other people that share our passion for computer science.
